Technology for N recovery as ammonium sulphate from co-digestion of corn silage, chicken manure and other biowaste by BENAS process

https://nutriman.net/farmer-platform/technology/id 668

KEY TECHNOLOGY FACTS

- Recover N from maize silage and poultry manure by anaerobic digestion with a modified stripping process;
- Reach a recovery rate of 80% of ammonia contained in the digestate (approximately 200 t/y);
- Reuse the exhaust heat from the CHP engine and the gypsum from Flue Gas Desulphurisation (FGD) of coal power plants.
- Productivity: ammonium sulphate solution 5-40 t/d, Lime 1.5-14 t/d

TRL 8

ADVANTAGES & BENEFITS

- Reduction of emissions (ammonia), loads of groundwater (nitrate) and losses of nitrogen from digestate. Reduction of transportation costs and costs for storage
- of the digestate. High potential to increase the yield and to reduce the
- costs for biogas concepts with nitrogen-rich substrate (e.g. chicken dung).
- Important step for a total treatment to a pure water and for closing fertilizer loops.

This project has received funding From the European Union's Horizon 2020 research and innovation programme under grant agreement No. 818470
